

YOU CAN HAVE A KITTING SYSTEM & PROCESS THAT ACTUALLY WORKS

Medical device companies solve their kitting struggles by taking advantage of true piece level tracking within the complete kit management functionality offered by Movemedical's cloud-based field inventory solution.

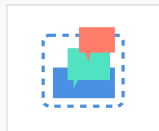

Your Current System

VS

Your Future System

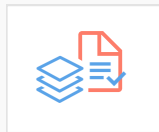

- Tracks kits only at the parent level. Individual stock items are not tracked separately, so accuracy is off and planning is cumbersome.

+ Track kits and every component inside each kit together and separately, so you can:

- See if it has enough to fulfill the next case
- Pull pieces out to fill another kit

- Tracks only kit BOM or standard, and not actual stock levels by individual item.

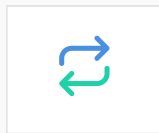

+ Know all your BOMs & how the current stock level compares.

- Non standard and custom kits cause verification issues. Kit verification is performed against a standard or expected contents instead of actual contents of what was last shipped inside the kit.

+ True kit visibility based on current kit contents for fast and accurate verification.

- Receiving and verification is inefficient and often not possible for field users. Inventory levels are constantly inaccurate or expired, thus delaying shipping and asset allocation.

+ Simple receive and transfer by all users maintains data integrity and enables faster turn-around.
